DEPARTMENT OF PHYSICS · IIT KANPUR

Rigorous physics. Versatile problem-solvers.

Founded in 1960, the Department of Physics at IIT Kanpur is one of India's most respected physics departments, recognised internationally for pioneering research and outstanding teaching. Its faculty lead research across almost every branch of modern physics, from quantum technologies and condensed matter to high-energy physics, cosmology, photonics, soft matter and complex systems.

For employers, that means students trained to think quantitatively, to build and test models of complex systems, and to turn data into insight, whether at a lab bench, on a supercomputer or at a whiteboard.

WHAT SETS US APART

○ Six decades of excellence

A legacy built since 1960. Our alumni include winners of the Breakthrough Prize, the Dirac Medal and the Boltzmann Medal.

○ Breadth with depth

Six major research verticals, with a deliberate balance of theory, computation and experiment.

○ Interdisciplinary by design

Undergraduates can add a second major or a minor in Computer Science, Economics, Mathematics and more.

○ Research-trained talent

Most programmes include a full year of supervised research, so students arrive used to owning open-ended problems.

“

MESSAGE FROM THE HEAD

The Department of Physics at IIT Kanpur has been known since its founding for excellence in teaching and research, and is widely regarded as one of India's most prestigious physics departments. We work across nearly every branch of modern physics, keeping a harmonious balance between theoretical exploration and experimental investigation, in an academic environment that reaches well beyond the classroom.

Today the department has 48 faculty members, over 230 PhD students and 15 postdoctoral fellows. Our goal is to train and nurture young talent to excel in whatever field they choose. We warmly invite you to meet and engage with our students.

Prof. Dipankar Chakrabarti

Head, Department of Physics

THE PHYSICS ADVANTAGE

Trained to solve problems that don't come with a manual

Physics teaches students to take an unfamiliar, messy system, build a model of it, test that model against data and keep refining it. Our students do this every week in courses, laboratories and research projects. The result is talent that gets up to speed quickly in new domains, whether that means pricing a derivative, building a recommendation engine or designing a quantum sensor.

01 First-principles problem solving

Breaking complex, unstructured problems into tractable models, and being explicit about assumptions, approximations and limits.

FITS Consulting · Strategy · Product

02 Mathematical & statistical modelling

Linear algebra, differential equations, probability, stochastic processes and statistical mechanics: the core toolkit of quantitative work.

FITS Quant research · Risk · Pricing

03 Scientific computing

Numerical methods and simulation in Python and C/C++, from quick scripts to large parallel codes on high-performance clusters.

FITS Software · HPC · Engineering simulation

04 Data analysis & machine learning

Extracting signal from noisy, high-volume data with statistical inference and ML, which is routine in particle physics and materials research.

FITS Data science · Analytics · AI / ML

05 Experimental design & instrumentation

Building, calibrating and debugging precision set-ups with lasers, cryogenics, vacuum systems, electronics and nanofabrication.

FITS Semiconductors · Photonics · Quantum hardware

06 Research ownership & communication

Driving long, open-ended projects to completion, then writing up and presenting the results to expert audiences.

FITS R&D · Technical leadership · Client-facing roles

Where our graduates thrive

Finance & Quant

Quant research, trading strategy, risk modelling

JPMorgan Chase · Morgan Stanley · Graviton Research Capital · FinMechanics · Vantage Research

Technology & E-commerce

Data science, ML engineering, software development

Oracle · Samsung · Flipkart · Walmart · Rakuten · Tata 1mg

Consulting & Analytics

Strategy consulting, business analytics, decision science

Boston Consulting Group · American Express

Deep-tech R&D

Quantum, photonics, semiconductor and materials R&D

A fast-growing area of opportunity that matches our research strengths

PROGRAMMES OFFERED

Five programmes. One standard of rigour.

From four-year undergraduates to doctoral researchers, every programme pairs deep theory with laboratory and computational training, so you can hire for the depth a role needs.

BS UNDERGRADUATE	Bachelor of Science in Physics A rigorous foundation in core physics, mathematics and computation. Students may add a second major or a minor in departments such as Computer Science, Economics or Mathematics.	DURATION 4 years ENTRY JEE Advanced HIRE FOR Internships · Full-time roles
BS—MS DUAL DEGREE	Bachelor & Master of Science Extends the BS with advanced coursework and a full year of rigorous research, which builds independent project ownership. A minor in another discipline is also possible. <i>Successor to the five-year integrated MSc offered since the 1960s.</i>	DURATION 5 years ENTRY JEE Advanced (via BS) HIRE FOR Internships · Full-time · R&D
MSc POSTGRADUATE	Master of Science Intensive advanced coursework followed by a year of research, for students who already hold a bachelor's degree.	DURATION 2 years ENTRY IIT JAM HIRE FOR Internships · Full-time roles
MSc—PhD DUAL DEGREE	Master of Science & Doctor of Philosophy A combined master's and doctoral track that pairs rigorous coursework with a doctoral research thesis.	ENTRY IIT JAM HIRE FOR R&D · Research-intensive roles
PhD DOCTORAL	Doctor of Philosophy Focused on creating new knowledge rather than learning existing knowledge. Graduates have taken a multi-year research project from idea to publication. <i>Direct entry is also open to IIT four-year graduates with CPI above 8.0, and to GATE toppers.</i>	ENTRY Written test & interview , with a national fellowship (GATE, CSIR / UGC, INSPIRE, PMRF, JEST) HIRE FOR R&D labs · Quant research · Data science

Selected through national competition

JEE Advanced and IIT JAM are among India's most competitive entrance examinations. Our students are the top performers from these exams.

Physics plus a second discipline

Second majors and minors in Computer Science, Economics and Mathematics produce graduates who combine physics with formal training in another field.

WHAT OUR STUDENTS LEARN

Fundamentals first, the frontier next

Every student first masters the core of physics, then specialises in one or more advanced tracks taught by active researchers.

Courses marked ● have a strong computational, statistical or data component.

Instrumentation & data acquisition

Learning beyond the classroom

Project courses, summer research and, in the BS–MS and MSc programmes, a full year of research. Students learn to define a problem, plan the work, deliver results and defend them.

RESEARCH STRENGTH

01 Quantum Technologies, Optics & Photonics

From entangled photons to trapped ions, these groups build and study the hardware of the coming quantum era, alongside the classical photonics that already powers communication and imaging.

INDUSTRY
RELEVANCE

Quantum computing Quantum communication
 Sensing & metrology Optical & fibre communication
 Imaging Photonic devices

SKILLS STUDENTS
BUILD

Lasers & precision optics Photon counting & correlations
 Vacuum & cold-atom systems Instrumentation
 Optical modelling

FACULTY & FOCUS

- Anand Kumar Jha** Professor
Quantum Optics & Entanglement Lab: optical coherence, orbital-angular-momentum entanglement, high-dimensional quantum states, imaging and communication through scattering and turbulent media
- Saikat Ghosh** Associate Professor
Quantum Measurement Lab: coherence in room-temperature atomic ensembles, photon correlations in cold atoms, graphene optomechanics, instrumentation
- Sapam Ranjita Chanu** Assistant Professor
Cold Atoms & Ions Quantum Technologies Lab: quantum computation and simulation with cold ions, quantum metrology, quantum states of light
- R. Vijaya** Professor
Photonics Laboratory: non-linear and fibre optics, photonic band-gap structures, RF antennas and frequency-selective surfaces
- Harshawardhan Wanare** Professor
 Non-linear optics and imaging
- Venkata Jayasurya Yallapragada** Assistant Professor
 Nanophotonics: nanoscale light emitters and scatterers, biogenic photonic structures
- Sudipta Dubey** Assistant Professor
Quantum Materials & Devices: atomically thin materials, quantum emitters, valleytronics, twistrionics and moiré physics

RESEARCH STRENGTH

02 Experimental Condensed Matter & Quantum Materials

Hands-on research on the materials that will define next-generation electronics: superconductors, magnets, and topological and two-dimensional materials, grown, fabricated and measured in our own laboratories.

INDUSTRY
RELEVANCE

Semiconductors Nanoelectronics Spintronics & memory
Superconducting devices Sensors Advanced materials

SKILLS STUDENTS
BUILD

Crystal & thin-film growth Device fabrication
Cryogenic measurement Spectroscopy
Scanning-probe microscopy

FACULTY & FOCUS

- Anjan Kumar Gupta** Professor
Scanning tunnelling microscopy, superconductivity
- Chanchal Sow** Associate Professor
Magnetism in complex oxides, interplay of ferromagnetism and superconductivity, single-crystal and thin-film growth
- Chandrima Banerjee** Assistant Professor
Ultrafast Light-Matter Interaction: ultrafast magnetisation dynamics, magneto-optical and Brillouin light-scattering spectroscopy, micromagnetic simulation
- Jayita Nayak** Associate Professor
Angle-resolved photoemission spectroscopy of topological insulators and high- T_c superconductors
- Rajeev Gupta** Professor
Optical Spectroscopy Lab: strongly correlated electron systems, multiferroics and oxides, nanomaterials
- Rohit Medwal** Assistant Professor
Nanomagnetism, spin transport and high-frequency spin dynamics
- Satyajit Banerjee** Professor
Superconductivity, magnetism and 2D materials, topological insulators, magneto-optical tools and sensors
- Soumik Mukhopadhyay** Professor
Magneto-electronics Lab: van der Waals magnets, spin-based nanoelectronics, topological Kondo systems, multiferroics, spin liquids
- Subhomoy Haldar** Assistant Professor
Semiconductor physics, quantum devices, single-photon detection, magneto-optical transport
- Zakir Hossain** Professor
Superconductivity, strongly correlated electron systems

Magnetic levitation of a superconductor

Moiré lattice in twisted 2D materials

RESEARCH STRENGTH

03 Theoretical & Computational Condensed Matter

Theory that predicts how electrons behave in new materials and devices, combining analytical modelling with large-scale computation and machine learning.

INDUSTRY
RELEVANCE

Materials discovery Device modelling Quantum computing
Energy materials Simulation software

SKILLS STUDENTS
BUILD

Analytical modelling Many-body numerics
Density-functional theory ML for materials HPC workflows

FACULTY & FOCUS

- Adhip Agarwala** Assistant Professor
Theoretical quantum condensed matter: topological phases of matter, magnets and anyons, open quantum systems
- Amit Agarwal** Professor
Quantum Transport & Theory Group: electronic and optical properties of topological materials, DFT-based discovery of 2D and magnetic materials, plasmons and spin excitations, nanoscale device modelling
- Arijit Kundu** Professor
Transport & Topology: equilibrium and non-equilibrium quantum transport, Floquet topological systems, Weyl semimetals, superconductor heterostructures
- Koushik Pal** Assistant Professor
Materials Physics Group: band and defect engineering of quantum materials, photovoltaics and thermoelectrics, thermal transport, data-driven design of functional materials
- Manoj K. Harbola** Professor
Atomic and molecular physics, density-functional methods
- Sudeep Kumar Ghosh** Assistant Professor
Theoretical exploration of quantum matter: superconductivity and magnetism, topological order, ultracold atoms
- Tarun Kanti Ghosh** Professor
Ultracold atomic gases, nanoscopic physics

04 Plasma, Ion Beams & Atomic Collisions

INDUSTRY RELEVANCE Semiconductor plasma processing · Ion-beam nanofabrication · Surface engineering · Accelerator & vacuum technology

- Sudeep Bhattacharjee** Professor
Waves & Beams Lab: compact and cryogenic plasmas, plasma-based focused ion beams, surface modification by low-energy ion beams, atmospheric-pressure microplasmas
- Aditya H. Kelkar** Associate Professor
Experimental atomic collision physics with heavy ions and electrons, accelerator physics

RESEARCH STRENGTH

05 Soft Matter, Biophysics & Complex Systems

From turbulence in stars to bacteria on a surface, these groups model and measure systems far from equilibrium, using some of the department's largest simulations and most versatile experiments.

INDUSTRY
RELEVANCE

CFD & HPC Polymers & formulations
Microfluidics & diagnostics Epidemiological modelling
Game theory & markets

SKILLS STUDENTS
BUILD

Large-scale simulation Non-linear & stochastic modelling
Optical trapping Image analysis Rheology

FACULTY & FOCUS

- Mahendra K. Verma** Professor
Turbulence Hub: magnetohydrodynamic turbulence and dynamos, buoyancy-driven convection, high-performance computing, non-equilibrium statistical physics
- Sagar Chakraborty** Professor
Non-linear Dynamics & Game Theory Group: non-linear dynamics, evolutionary game theory
- Supratik Banerjee** Associate Professor
Space Plasmas & Astrofluids: compressible and solar-wind turbulence, ferrofluids, active-matter turbulence, mathematical models of epidemiology
- Taraknath Mandal** Associate Professor
Computational Soft Matter & Biophysics: multiscale molecular modelling of polymers, rheology of micellar solutions, protein-membrane interactions
- Sivasurender Chandran** Assistant Professor
Soft & Biological Matter Lab: stability of thin polymer films, polymer nanocomposites, active solutions, bacterial biofilms and swarming
- Krishnacharya** Professor
Soft Matter Physics Lab: open microfluidics, elastic instabilities, electrowetting on dielectrics, chemically heterogeneous surfaces
- Manas Khan** Assistant Professor
Soft & Active Matter Lab: optical trapping and microrheology, active Brownian particles, colloidal crystals, deformability of red blood cells

Simulated turbulent flow

Solar wind meets Earth's magnetosphere

Lorenz attractor

Brownian dynamics simulations of microrheology

RESEARCH STRENGTH

06 High Energy Physics, Cosmology & Astrophysics

From string theory to collider data, this is the most mathematically demanding work in physics, and some of the most data-intensive.

INDUSTRY RELEVANCE

Big-data analytics Machine learning Statistical inference
 Distributed computing Quantitative finance

SKILLS STUDENTS BUILD

OUR PEOPLE

48 faculty across six research verticals

Adhip Agarwala Theoretical quantum condensed matter physics

Aditya H. Kelkar Experimental atomic collision physics, heavy-ion and electron collisions, accelerator physics

Amit Agarwal Quantum many-body effects, low-dimensional quantum systems

Anand Kumar Jha Quantum optics

Anjan Kumar Gupta Scanning tunnelling microscopy, superconductivity

Apratim Kaviraj Theoretical high energy physics, conformal field theories, critical phenomena

Arijit Kundu Equilibrium and non-equilibrium quantum transport; topological systems in condensed matter

Arjun Bagchi Theoretical high energy physics, string theory

Chanchal Sow Magnetism in complex oxides, ferromagnetism–superconductivity interplay, single-crystal and thin-film growth

Chandrima Banerjee Experimental condensed matter, magneto-optic spectroscopy, ultrafast light–matter interaction

Debtosh Chowdhury Theoretical particle physics, cosmology and astroparticle physics, Standard Model phenomenology

Dipankar Chakrabarti Quantum chromodynamics, lattice gauge theory and light-cone field theories

Diptarka Das Conformal field theories, non-equilibrium physics, string theory

Gopal Hazra Astrophysical magnetic fields, exoplanets and their atmospheres, solar and planetary winds

Goutam Das Perturbative quantum chromodynamics, effective field theory

Harshawardhan Wanare Non-linear optics, imaging

Jayita Nayak ARPES of topological insulators and high- T_c superconductors

Joydeep Chakraborty Effective and quantum field theory, spectral functions, heat kernel

Kaushik Bhattacharya Cosmology, particle physics

Koushik Pal Materials theory and simulation, materials informatics and machine learning

Krishnacharya Soft matter physics

Mahendra K. Verma Non-linear physics, magnetohydrodynamics

Manas Khan Statistical physics of soft and active matter, optical trapping and micromanipulation

Manoj K. Harbola Atomic and molecular physics

Navaneeth Poonthottathil Experimental high energy physics

Nilay Kundu Theoretical high energy physics, string theory

R. Vijaya Fibre optics, non-linear optics, photonic band-gap structures

Rajeev Gupta Optical spectroscopy and phases

Rohit Medwal Nanomagnetism, spin transport and high-frequency spin dynamics

Sabyasachi Chakraborty Theoretical particle physics

Sagar Chakraborty Non-linear dynamics, evolutionary game theory

Saikat Ghosh Quantum optics

WAYS TO ENGAGE

Full-time roles

Graduating BS, BS-MS, MSc and PhD students for analytical, technical and research positions.

Summer internships

Pre-final-year students for focused summer projects, an effective route to pre-placement offers.

R&D & PhD hiring

Doctoral researchers for R&D labs, quant research, data science and deep-tech teams.

Research collaboration

Sponsored projects, consultancy and joint research with our faculty groups.

HOW CAMPUS HIRING WORKS

1

Register

Create a recruiter account with the Students' Placement Office at spo.iitk.ac.in.

2

Announce

Share the role, eligibility and timeline, and name the programmes you want to hire from.

3

Engage

Pre-placement talk, tests and interviews, on campus or online.

4

Offer

Make offers through the SPO during the placement or internship season.

GET IN TOUCH

Let's talk talent

Our placement team will help you find the right students for your roles, from summer interns to PhD researchers.
